Spring 2012

Setup of Linear Regression Model

- ▶ We now consider the **regression model** in which a response variable Y is related to one or more **explanatory** or **predictor** variables X_1, X_2, \dots, X_{k-1} .
- ▶ For a random sample of n individuals, our model is

$$Y_i = \beta_0 + \beta_1 X_{i1} + \beta_2 X_{i2} + \cdots + \beta_{k-1} X_{i,k-1} + \epsilon_i, \quad \epsilon_i \stackrel{\text{indep}}{\sim} N(0, \sigma^2)$$

Setup of Linear Regression Model

- ▶ This model can be written in matrix form as

$$\mathbf{Y} = \mathbf{X}\boldsymbol{\beta} + \boldsymbol{\epsilon}, \quad \boldsymbol{\epsilon} \sim MVN(\mathbf{0}, \sigma^2 \mathbf{I}_n)$$

where

$$\mathbf{Y} = \begin{bmatrix} Y_1 \\ \vdots \\ Y_n \end{bmatrix}, \quad \mathbf{X} = \begin{bmatrix} 1 & X_{11} & \cdots & X_{1,k-1} \\ 1 & X_{21} & \cdots & X_{2,k-1} \\ \vdots & \vdots & \ddots & \vdots \\ 1 & X_{n1} & \cdots & X_{n,k-1} \end{bmatrix},$$

$$\boldsymbol{\epsilon} = \begin{bmatrix} \epsilon_1 \\ \vdots \\ \epsilon_n \end{bmatrix}, \quad \boldsymbol{\beta} = \begin{bmatrix} \beta_0 \\ \beta_1 \\ \vdots \\ \beta_{k-1} \end{bmatrix}$$

Likelihood for Linear Regression Model

- ▶ Based on this normal model, the likelihood is:

$$L(\beta, \sigma^2 | \mathbf{X}, \mathbf{y}) = (2\pi\sigma^2)^{-\frac{n}{2}} e^{-\frac{1}{2\sigma^2}(\mathbf{y} - \mathbf{X}\beta)'(\mathbf{y} - \mathbf{X}\beta)}$$

- ▶ Note that the **least squares** estimates of β and σ^2 are:

$$\hat{\mathbf{b}} = (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{y}, \quad \hat{\sigma}^2 = \frac{(\mathbf{y} - \mathbf{X}\hat{\mathbf{b}})'(\mathbf{y} - \mathbf{X}\hat{\mathbf{b}})}{n - k}$$

Likelihood for Linear Regression Model

Then $L(\beta, \sigma^2 | \mathbf{X}, \mathbf{y})$

$$\propto \sigma^{-n} \exp\left\{-\frac{1}{2\sigma^2}(\mathbf{y}'\mathbf{y} - 2\beta'\mathbf{X}'\mathbf{y} + \beta'\mathbf{X}'\mathbf{X}\beta)\right\}$$

$$\begin{aligned} &= \sigma^{-n} \exp\left\{-\frac{1}{2\sigma^2}\left(\mathbf{y}'\mathbf{y} - 2\beta'\mathbf{X}'\mathbf{y} + \beta'\mathbf{X}'\mathbf{X}\beta\right.\right. \\ &\quad \left.\left.- 2[(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{y}]'\mathbf{X}'\mathbf{y} + 2[(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{y}]'\mathbf{X}'\mathbf{X}[(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{y}]\right)\right\} \end{aligned}$$

Since $\mathbf{X}'\mathbf{y} = \mathbf{X}'\mathbf{X}\hat{\mathbf{b}}$,

$$\begin{aligned} &= \sigma^{-n} \exp\left\{-\frac{1}{2\sigma^2}\left(\mathbf{y}'\mathbf{y} - 2\beta'\mathbf{X}'\mathbf{X}\hat{\mathbf{b}} + \beta'\mathbf{X}'\mathbf{X}\beta\right.\right. \\ &\quad \left.\left.- 2[(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{X}\hat{\mathbf{b}}]'\mathbf{X}'\mathbf{X}\hat{\mathbf{b}}\right.\right. \\ &\quad \left.\left.+ 2[(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{X}\hat{\mathbf{b}}]'\mathbf{X}'\mathbf{X}[(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{X}\hat{\mathbf{b}}]\right)\right\} \end{aligned}$$

Likelihood for Linear Regression Model

$$\begin{aligned} &= \sigma^{-n} \exp \left\{ -\frac{1}{2\sigma^2} \left(\mathbf{y}' \mathbf{y} - 2\hat{\mathbf{b}}' \mathbf{X}' \mathbf{y} + \hat{\mathbf{b}}' \mathbf{X}' \mathbf{X} \hat{\mathbf{b}} + 2\hat{\mathbf{b}}' \mathbf{X}' \mathbf{X} \hat{\mathbf{b}} \right. \right. \\ &\quad \left. \left. - \hat{\mathbf{b}}' \mathbf{X}' \mathbf{X} \hat{\mathbf{b}} - 2\hat{\mathbf{b}}' \mathbf{X}' \mathbf{X} \hat{\mathbf{b}} + 2\hat{\mathbf{b}}' \mathbf{X}' \mathbf{X} \hat{\mathbf{b}} - 2\beta' \mathbf{X}' \mathbf{X} \hat{\mathbf{b}} + \beta' \mathbf{X}' \mathbf{X} \beta \right) \right\} \\ &= \sigma^{-n} \exp \left\{ -\frac{1}{2\sigma^2} [(\mathbf{y} - \mathbf{X} \hat{\mathbf{b}})' (\mathbf{y} - \mathbf{X} \hat{\mathbf{b}}) + \hat{\mathbf{b}}' \mathbf{X}' \mathbf{X} \hat{\mathbf{b}} \right. \\ &\quad \left. - 2\beta' \mathbf{X}' \mathbf{X} \hat{\mathbf{b}} + \beta' \mathbf{X}' \mathbf{X} \beta] \right\} \\ &= \sigma^{-n} \exp \left\{ -\frac{1}{2\sigma^2} [\hat{\sigma}^2(n - k) + (\beta - \hat{\mathbf{b}})' \mathbf{X}' \mathbf{X} (\beta - \hat{\mathbf{b}})] \right\} \end{aligned}$$

Noninformative Priors for β and σ^2

Consider the independent vague priors

$$p(\beta) \propto 1, \quad \beta \in (-\infty, \infty)^k$$

$$\text{and } p(\sigma^2) = \frac{1}{\sigma}, \quad \sigma \in (0, \infty)$$

Then the joint posterior for β and σ^2 is:

$$\begin{aligned}\pi(\beta, \sigma^2 | \mathbf{X}, \mathbf{y}) &\propto L(\beta, \sigma^2 | \mathbf{X}, \mathbf{y}) p(\beta) p(\sigma^2) \\ &\propto \sigma^{-n-1} \exp\left\{-\frac{1}{2\sigma^2} [\hat{\sigma}^2(n-k) + (\beta - \hat{\mathbf{b}})' \mathbf{X}' \mathbf{X} (\beta - \hat{\mathbf{b}})]\right\}\end{aligned}$$

Noninformative Priors for β and σ^2

- ▶ Using the transformation $s = \sigma^{-2}$ with Jacobian $|J| = \frac{1}{2}s^{-3/2}$:

$$\begin{aligned}\pi(\beta, s | \mathbf{X}, \mathbf{y}) &\propto (s^{-1/2})^{-n-1} \exp\left\{-\frac{1}{2}s[\hat{\sigma}^2(n-k)\right. \\&\quad \left.+ (\beta - \hat{\mathbf{b}})' \mathbf{X}' \mathbf{X}(\beta - \hat{\mathbf{b}})]\right\} \left(\frac{1}{2}s^{-3/2}\right) \\&\propto (s)^{\frac{n}{2}-1} \exp\left\{-\frac{1}{2}s[\hat{\sigma}^2(n-k) + (\beta - \hat{\mathbf{b}})' \mathbf{X}' \mathbf{X}(\beta - \hat{\mathbf{b}})]\right\}\end{aligned}$$

Noninformative Priors for β and σ^2

- ▶ To get the marginal posterior for β , integrate out s :

So $\pi(\beta | \mathbf{X}, \mathbf{y})$

$$\begin{aligned} &= \int_0^\infty (s)^{\frac{n}{2}-1} \exp\left\{-\frac{1}{2}[\hat{\sigma}^2(n-k) + (\beta - \hat{\mathbf{b}})' \mathbf{X}' \mathbf{X}(\beta - \hat{\mathbf{b}})]s\right\} ds \\ &= \frac{\Gamma(\frac{n}{2})}{\frac{1}{2}[\hat{\sigma}^2(n-k) + (\beta - \hat{\mathbf{b}})' \mathbf{X}' \mathbf{X}(\beta - \hat{\mathbf{b}})]^{\frac{n}{2}}} \\ &\propto [(n-k) + (\beta - \hat{\mathbf{b}})' \hat{\sigma}^{-2} \mathbf{X}' \mathbf{X}(\beta - \hat{\mathbf{b}})]^{-\frac{n}{2}} \end{aligned}$$

- ▶ This is the kernel of a multivariate t-distribution with $(n-k)$ degrees of freedom and covariance matrix

$$\frac{(n-k)\hat{\sigma}^2(\mathbf{X}' \mathbf{X})^{-1}}{n-k-2}$$

Noninformative Priors for β and σ^2

- ▶ Now we integrate β out of the joint posterior to get the marginal posterior for σ^2 :

$$\begin{aligned}\pi(\sigma^2 | \mathbf{X}, \mathbf{y}) &\propto (\sigma)^{-n-1} e^{-\frac{1}{2\sigma^2} \hat{\sigma}^2(n-k)} \int_{-\infty}^{\infty} e^{-\frac{1}{2\sigma^2} (\beta - \hat{\beta})' \mathbf{X}' \mathbf{X} (\beta - \hat{\beta})} d\beta \\ &\propto (\sigma)^{-n-1} e^{-\frac{1}{2\sigma^2} \hat{\sigma}^2(n-k)} (2\pi\sigma^2)^{k/2} \\ &\propto (\sigma^2)^{-\frac{1}{2}(n-k-1)-1} e^{-\frac{\frac{1}{2}\hat{\sigma}^2(n-k)}{\sigma^2}}\end{aligned}$$

which is clearly an $IG(\frac{1}{2}(n - k - 1), \frac{1}{2}\hat{\sigma}^2(n - k))$ posterior distribution.

- ▶ Example: Oxygen update data on course web page
